# *Diagnostic Justification* Study – 4<sup>th</sup> year Medical Students

## **Examining the Diagnostic Justification Abilities of Fourth-Year Medical Students**

Reed G. Williams, PhD, and Debra L. Klamen, MD, MHPE

---

### Abstract

#### **Purpose**

Fostering ability to organize and use medical knowledge to guide data collection, make diagnostic decisions, and defend those decisions is at the heart of medical training. However, these abilities are not systematically examined prior to graduation. This study examined diagnostic justification (DXJ) ability of medical students shortly before graduation.

#### **Method**

All senior medical students in the Classes of 2011 (n = 67) and 2012 (n = 70) at Southern Illinois University were required to take and pass a 14-case, standardized

patient examination prior to graduation. For nine cases, students were required to write a free-text response indicating how they used patient data to move from their differential to their final diagnosis. Two physicians graded each DXJ response. DXJ scores were compared with traditional standardized patient examination (SCCX) scores.

#### **Results**

The average intraclass correlation between raters' rankings of DXJ responses was 0.75 and 0.64 for the Classes of 2011 and 2012, respectively. Student DXJ scores were consistent across the nine cases. Using SCCX and

DXJ scores led to the same pass–fail decision in a majority of cases. However, there were many cases where discrepancies occurred. In a majority of those cases, students would fail using the DXJ score but pass using the SCCX score. Common DXJ errors are described.

#### **Conclusions**

Commonly used standardized patient examination component scores (history/physical examination checklist score, findings, differential diagnosis, diagnosis) are not direct, comprehensive measures of DXJ ability. Critical deficiencies in DXJ abilities may thus go undiscovered.

### Validity Evidence for a Patient Note Scoring Rubric Based on the New Patient Note Format of the United States Medical Licensing Examination

Yoon Soo Park, PhD, Matthew Lineberry, PhD, Abbas Hyderi, MD, MPH, Georges Bordage, MD, PhD, Janet Riddle, MD, and Rachel Yudkowsky, MD, MHPE

---

#### Abstract

##### **Purpose**

This study examines validity evidence for the Patient Note Scoring Rubric, which was developed for a local graduation competency exam (GCE) to assess patient notes written in the new United States Medical Licensing Examination (USMLE) Step 2 Clinical Skills format. The rubric was designed to measure three dimensions: Documentation, justified differential diagnosis (DDX), and Workup.

##### **Method**

Analyses used GCE data from 170 fourth-year medical students who completed five standardized patient (SP) cases in

May 2012. Five physician raters each scored all responses for one case. Internal structure was examined using correlations between dimensions and between cases; a generalizability study was also conducted. Relationship to other variables was examined by correlating patient note scores with SP encounter scores. Consequence was assessed by comparing pass-fail rates between the rubric and the previous global rating. Response process was examined using rater feedback.

##### **Results**

Correlations between scores from different dimensions ranged between 0.33 and 0.44. Reliability of scores

based on the phi coefficient was 0.43; 15 cases were required to reach a phi coefficient of 0.70. Evidence of case specificity was found. Documentation scores were moderately correlated with SP scores for data gathering ( $r = 0.47$ ,  $P < .001$ ). There was no meaningful change in pass-fail rates. Raters' feedback indicated that they required more training for scoring the DDX and Workup dimensions.

##### **Conclusions**

There is initial validity evidence for use of this rubric to score local clinical exams that are based on the new USMLE patient note format.

### Characteristics and Implications of Diagnostic Justification Scores Based on the New Patient Note Format of the USMLE Step 2 CS Exam

Rachel Yudkowsky, MD, MHPE, Yoon Soo Park, PhD, Abbas Hyderi, MD, MPH, and Georges Bordage, MD, PhD

#### Abstract

##### Background

To determine the psychometric characteristics of diagnostic justification scores based on the patient note format of the United States Medical Licensing Examination Step 2 Clinical Skills exam, which requires students to document history and physical findings, differential diagnoses, diagnostic justification, and plan for immediate workup.

##### Method

End-of-third-year medical students at one institution wrote notes for five standardized patient cases in May 2013 (n = 180) and 2014 (n = 177). Each case was scored using a four-point rubric to rate each of the four note components. Descriptive statistics and item analyses

were computed and a generalizability study done.

##### Results

Across cases, 10% to 48% provided no diagnostic justification or had several missing or incorrect links between history and physical findings and diagnoses. The average intercase correlation for justification scores ranged from 0.06 to 0.16; internal consistency reliability of justification scores (coefficient alpha across cases) was 0.38. Overall, justification scores had the highest mean item discrimination across cases. The generalizability study showed that person–case interaction (12%) and task–case interaction (13%) had the

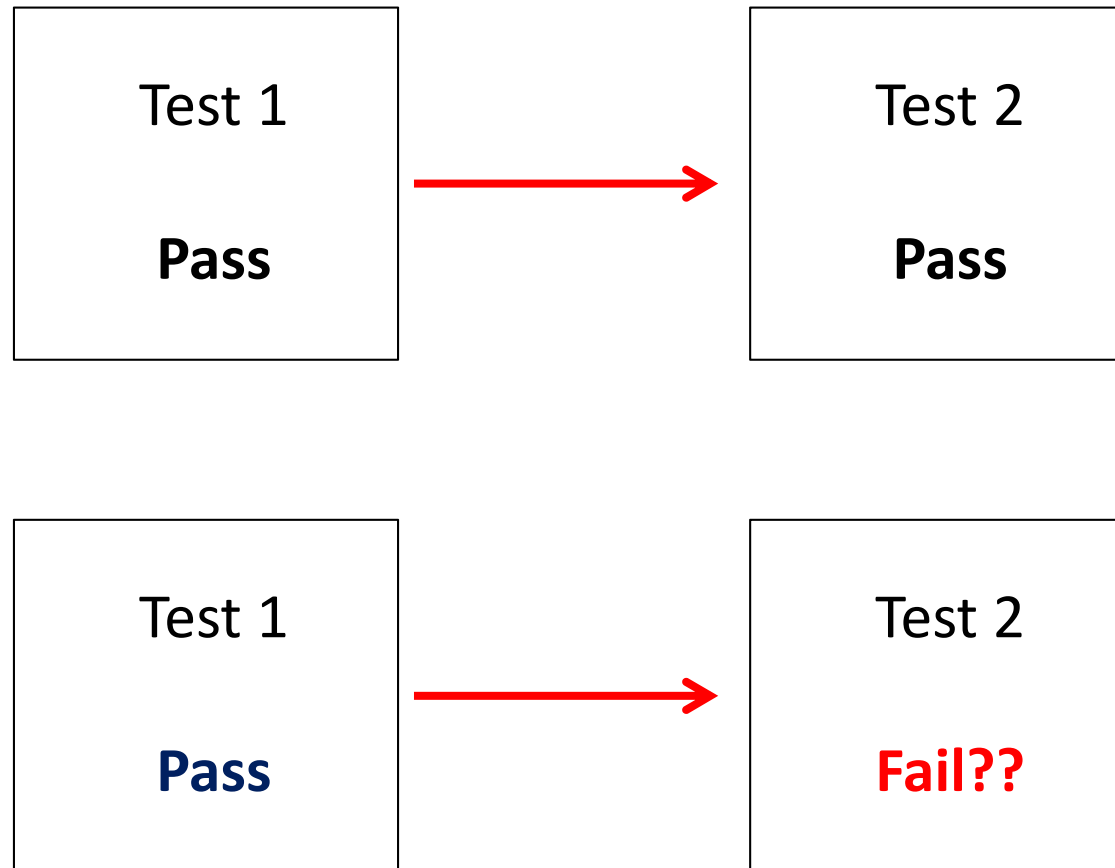

largest variance components, indicating substantial case specificity.

##### Conclusions

The diagnostic justification task provides unique information about student achievement and curricular gaps. Students struggled to correctly justify their diagnoses; performance was highly case specific. Diagnostic justification was the most discriminating element of the patient note and had the greatest variability in student performance across cases. The curriculum should provide a wide range of clinical cases and emphasize recognition and interpretation of clinically discriminating findings to promote the development of clinical reasoning skills.

Yudkowsky et al, *Academic Medicine*, 2015

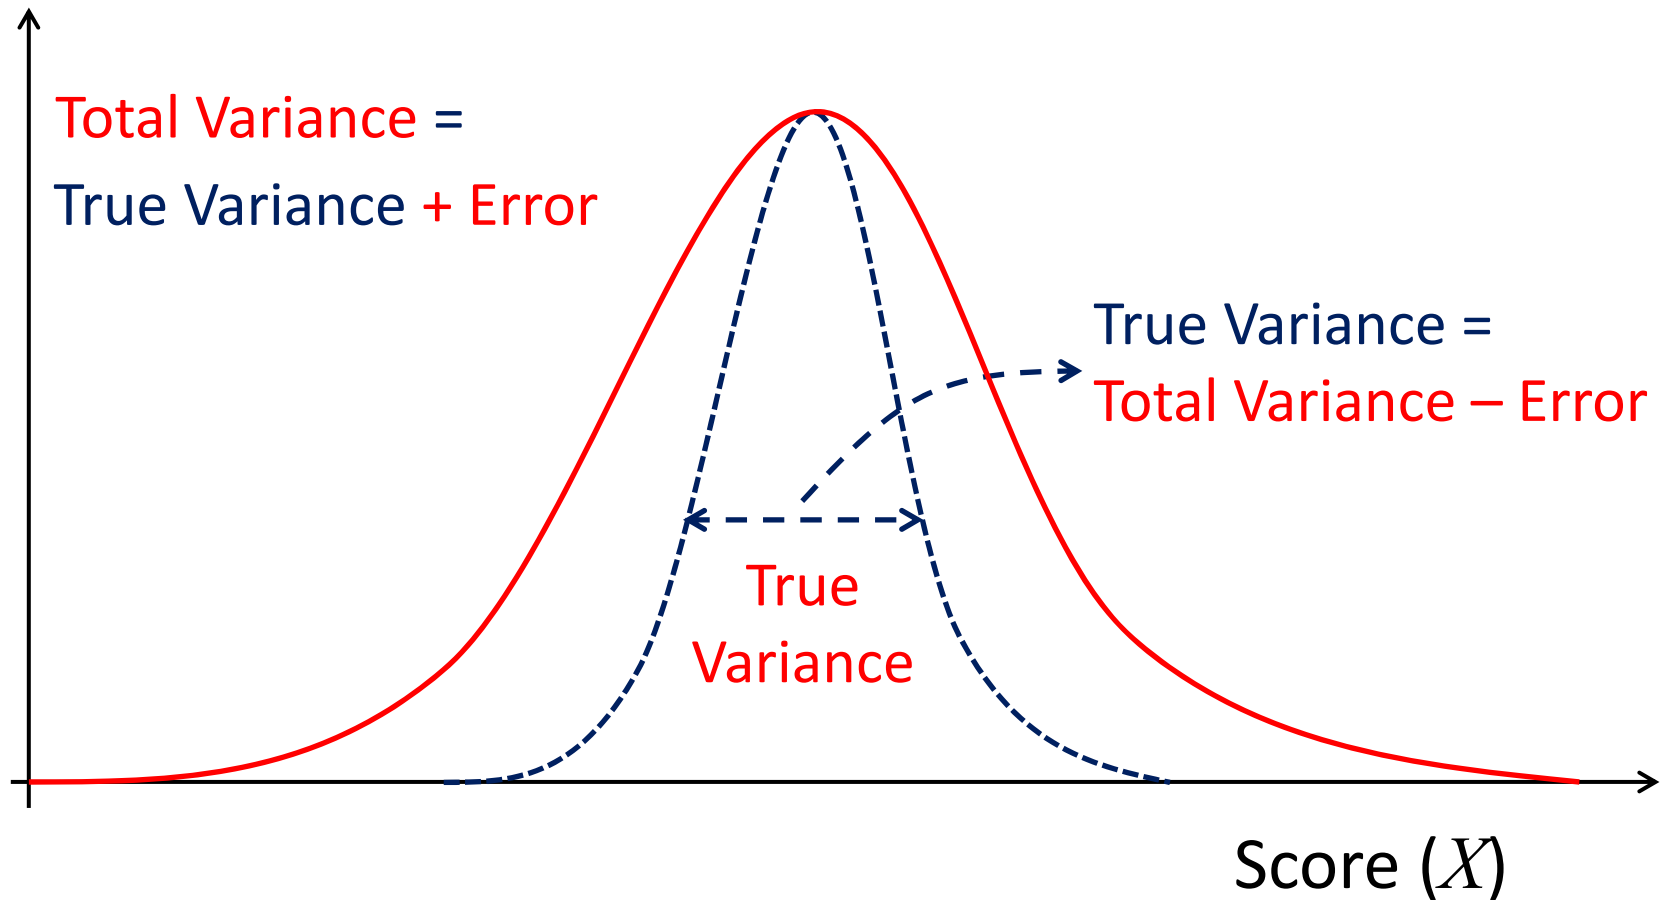

# Reliability as Consistency

$$\text{Reliability} = \frac{\text{"true" variance}}{\text{"true" variance} + \text{error}}$$

Frequency

# Reliability: Example

$$reliability = \frac{True\ Variance}{Total\ Variance} = \frac{True}{True + Error}$$

## Example (Note: Hypothetical!)

Test Mean = 65

Standard Deviation = 5

Total Variance = 25

Total (True + Error) = 25

→ True = 15, Error = 10

Reliability =

$$\frac{15}{25} = \frac{15}{15 + 10} = .60$$

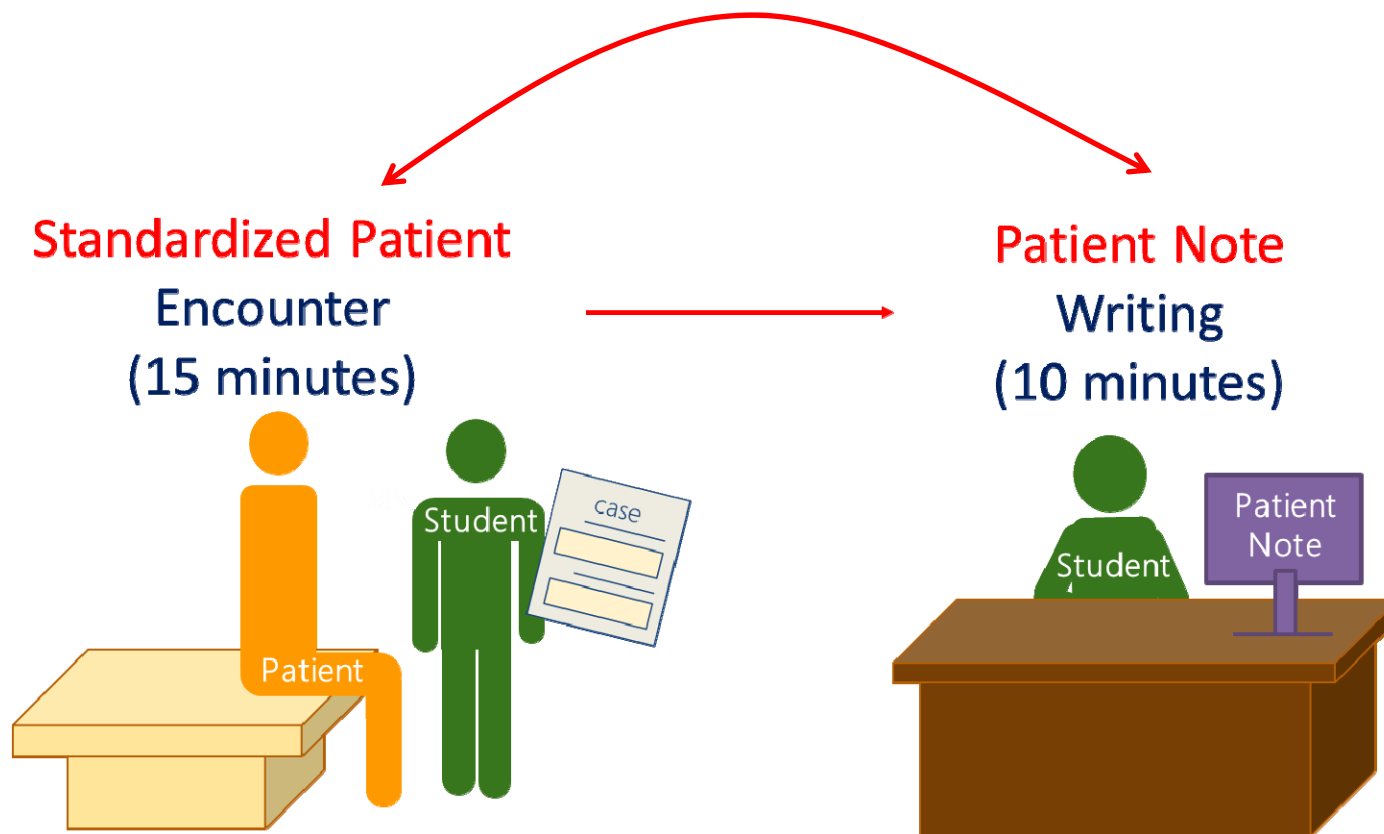

## Internal Structure: Reliability

- **Reliability** with 5 cases
  - G-coefficient: .47
  - $\Phi$ -coefficient: .43
- **Variance components**
  - Students: 6%
  - Student-case interaction (**case specificity**): 20%
- Need **15 cases** to reach  $\Phi$ -coefficient of **.70**

# Relations to other variables

Data Gathering:  $r = .47$

Total Score:  $r = .38$

## Paper 3: Rater Issues (Project Years: 2014-2016)

# Paper 4: Composite Measures

## (Project Years: 2015-2016)

### Differential Weighting for Subcomponent Measures of Integrated Clinical Encounter Scores Based on the USMLE Step 2 CS Examination: Effects on Composite Score Reliability and Pass-Fail Decisions

Yoon Soo Park, PhD, Matthew Lineberry, PhD, Abbas Hyderi, MD, MPH, Georges Bordage, MD, PhD, Kuan Xing, MEd, and Rachel Yudkowsky, MD, MHPE

#### Abstract

##### Purpose

Medical schools administer locally developed graduation competency examinations (GCEs) following the structure of the United States Medical Licensing Examination Step 2 Clinical Skills that combine standardized patient (SP)-based physical examination and the patient note (PN) to create integrated clinical encounter (ICE) scores. This study examines how different subcomponent scoring weights in a locally developed GCE affect composite score reliability and pass-fail decisions for ICE scores, contributing to internal structure and consequential validity evidence.

##### Method

Data from two M4 cohorts (2014:  $n = 177$ ; 2015:  $n = 182$ ) were used.

The reliability of SP encounter (history taking and physical examination), PN, and communication and interpersonal skills scores were estimated with generalizability studies. Composite score reliability was estimated for varying weight combinations. Faculty were surveyed for preferred weights on the SP encounter and PN scores. Composite scores based on Kane's method were compared with weighted mean scores.

##### Results

Faculty suggested weighting PNs higher (60%–70%) than the SP encounter scores (30%–40%). Statistically, composite score reliability was maximized when PN scores were

weighted at 40% to 50%. Composite score reliability of ICE scores increased by up to 0.20 points when SP-history taking (SP-Hx) scores were included; excluding SP-Hx only increased composite score reliability by 0.09 points. Classification accuracy for pass-fail decisions between composite and weighted mean scores was 0.77; misclassification was < 5%.

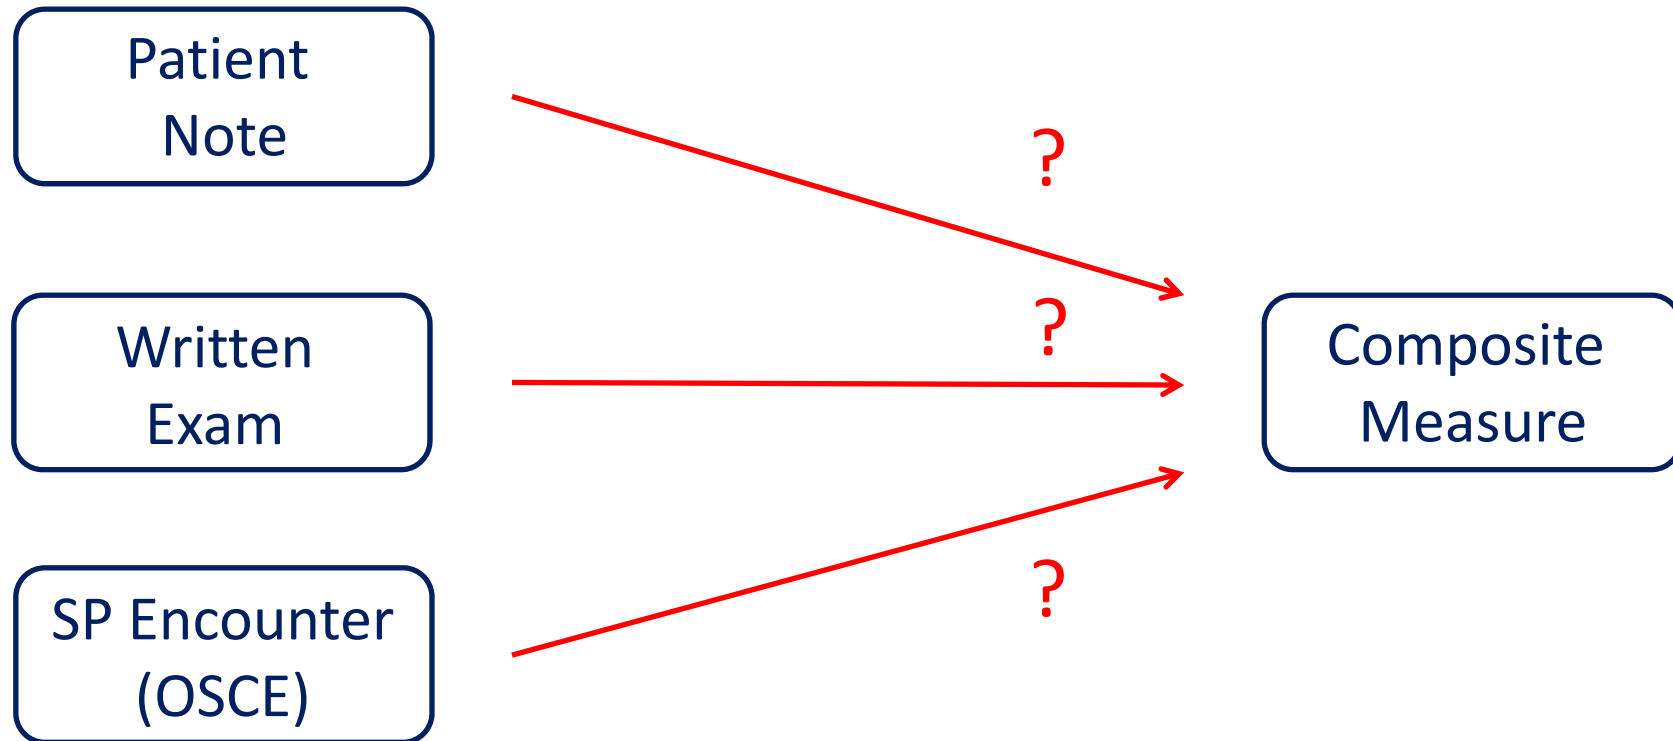

##### Conclusions

Medical schools and certification agencies should consider implications of assigning weights with respect to composite score reliability and consequences on pass-fail decisions.

Park et al, *Academic Medicine*, 2016
